Calculated Osmolality

mOsm/L

Value

279

Reference range not established – comparison with measured osmolality is required. Osmolal gap (measured – calculated osmolality) should be ≤ 10 mosm/Kg.

eGFR

Normal range: 60 ml/min/SA or above

eGFR calculated using patient's sex assigned at birth and/or legal sex, age and the CKD-EPI 2021 refit equation recommended by NKF/ASN Task Force (JASN December 2021,32 (12) 2994-3015). New calculation was implemented at Balladhealth labs on 12/05/2022.

Expected Reference Interval: ≥ 60 mL/min/1.73 square meters

CKD stages: I: >90 II:60-89 III:30-59 IV:15-29 V: <15
 Estimated GFR (eGFR) calculated using the CKD-EPI 2021 refit equation. Results should be interpreted with caution in situations that predispose to inaccuracies of the eGFR, including non-steady state creatinine (acute kidney injury), extremes of muscle mass/body size, high protein diets/supplement use, dialysis, loss of extracellular fluid, drugs interfering with renal tubular secretion (eg cimetidine, trimethoprim) or gut creatinase activity (antibiotics), and analytic interferences related to altered metabolites (glucose, ketones, bilirubin) or drugs.
